Re: Gummy Shrek

Dear: Referral Doctor's Office

Thank you for your referral and the opportunity to examine Gummy. He was seen for a limited periodontal examination. I made the following findings and recommendations:

Observations:

Thank you again for referring Mr Gummy Shrek to me for evaluation of recession on tooth #24. Upon clinical examination, I found Ms. Doe has 6 mm of gingival recession on the facial aspect of #24, extending beyond the mucogingival junction into the free gingiva.

Diagnosis: Miller Class III gingival recession

Prognosis: Good

Treatment Options:

I recommend a connective tissue graft combined with a coronally advanced flap. This will involve taking connective tissue from the palate to place over the receded root area. The gingival flap will be reflected, positioned more coronally, and sutured to provide additional root coverage. Recovery time is estimated at 4-6 weeks.

If we have any radiographs or intra-oral photos, we'll attach them to the email.

Thank you for your trust in our office.

Sincerely,

Betsy Mosquera, DDS, MSD
